CFD Lab: Final Project

3D Navier Stokes Code for Arbitrary Geometries

Norbert Schmidbartl, Wei Ni, Zhibin Cheng, Eva Breznik

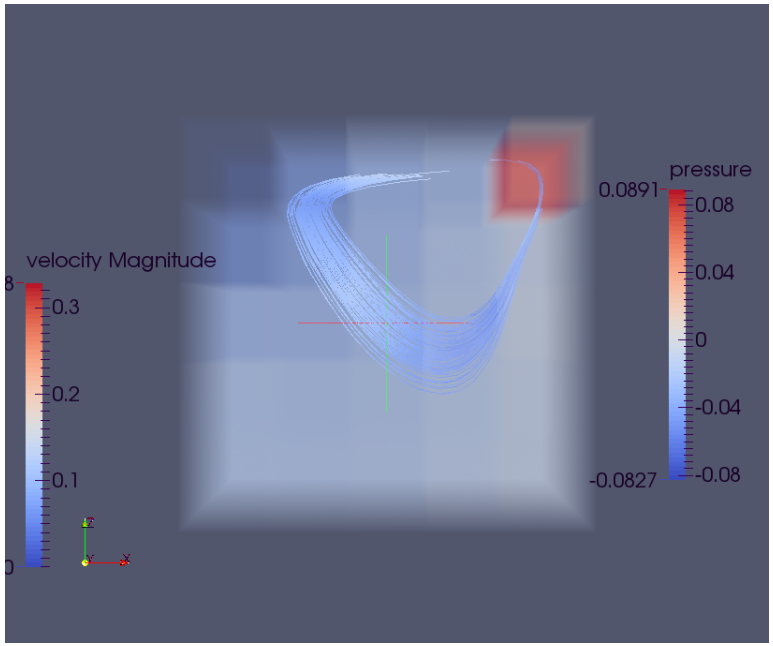
July 15, 2015

Project Topic

- 3D Navier Stokes for arbitrary geometries
- (TO remove Free Surface flow, unless we wanna explain why we didn't do it at the beginning of presentation??)



Project Topic

3D Navier Stokes for arbitrary geometries

- To handle truly arbitrary scenarios, our code allows any of the following standard boundary conditions to be employed in any domain cell:
  - no slip
  - free slip
  - inflow
  - outflow
  - moving wall
- Therefore, even the obstacles inside the domain can have arbitrary boundaries, as opposed to only allowing that on the domain walls (as in worksheet 3).

Implementation

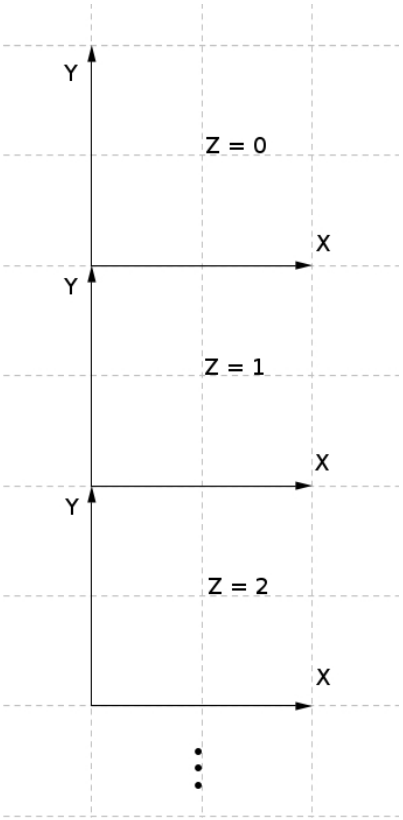
3D Navier Stokes for arbitrary geometries

- Special numbering of cells when generating input pgm files
- Geometries represented by a grayscale image with 7 levels of brightness.

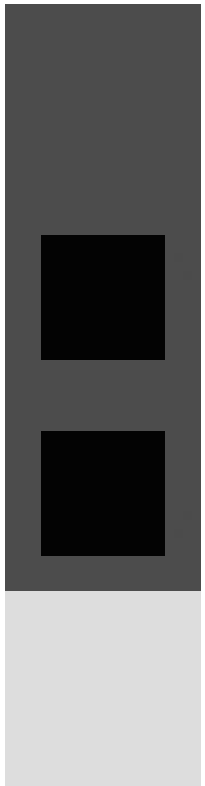
Cell type	Number code
water	0
air	1
no-slip	2
free-slip	3
inflow	4
outflow	5
moving wall	6

Lid driven cavity example case

...and its input pgm files



2	2	2	2
2	2	2	2
2	2	2	2
2	2	2	2
2	2	2	2
2	0	0	2
2	0	0	2
2	2	2	2
2	2	2	2
2	0	0	2
2	0	0	2
2	2	2	2
6	6	6	6
6	6	6	6
6	6	6	6
6	6	6	6



Implementation

Boundary conditions
